

would generate independent random sequences in parallel. The resulting random bit sequence passes the most widely accepted statistical tests used to evaluate cryptographic random number generators.

8. Acknowledgements

The authors thank Elizabeth Rogers-Dakin (Optical Air Data Systems) for providing the Er/Yb-doped fiber amplifiers used to generate ASE noise and Allen Chopyk (Tektronix) for providing the digital oscilloscope used to measure the high-speed waveforms. This work is supported by DOD MURI grant (ONR N000140710734).
